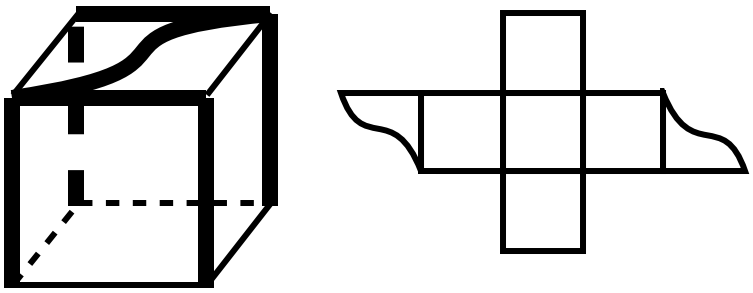
Unfoldings

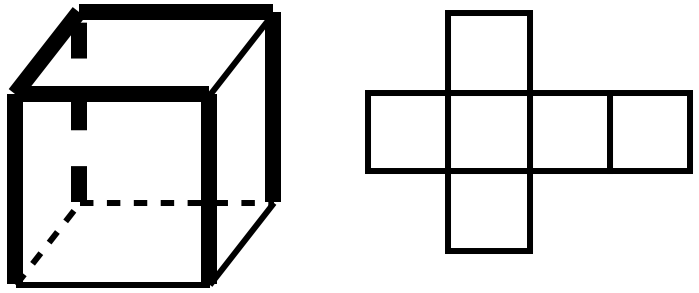
Definition 1 [E. D. Demaine and J. O'Rourke, 2007]

A general unfolding of a polyhedron is a flat polygon obtained by cutting along its edges and faces, then unfolding its faces into a plane. When the cuts are restricted to its edges, this is called an edge unfolding.

Cutting along the thick line on the left cube of each pair …



(a) General unfolding

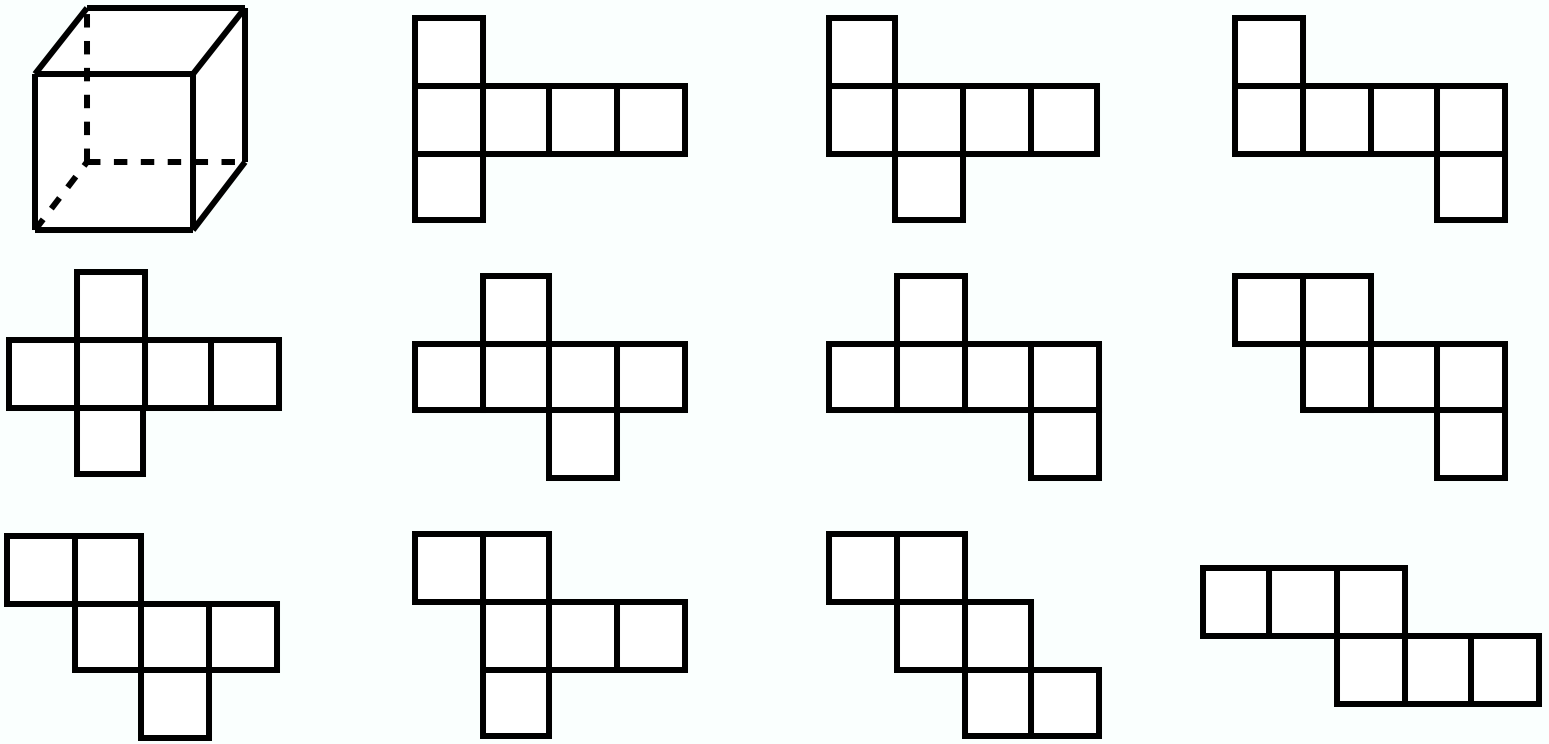


(b) Edge unfolding

#(Edge unfoldings)

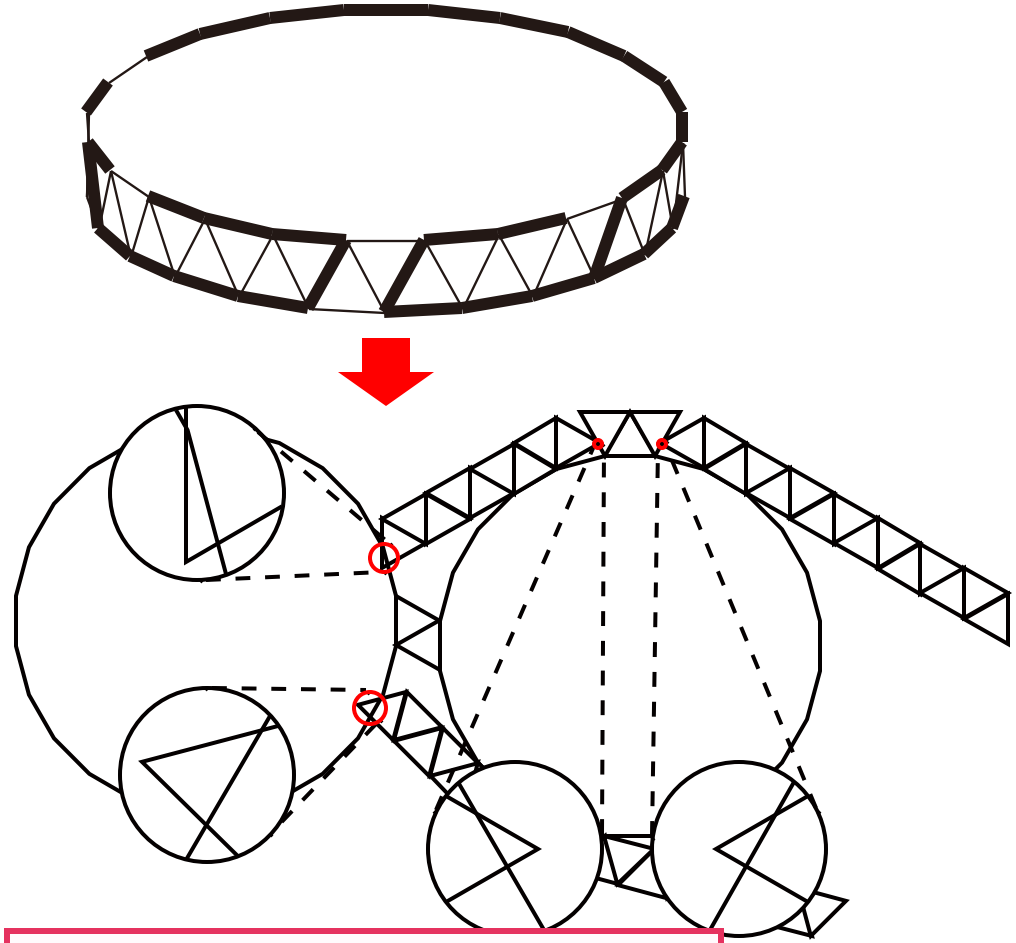
A polyhedron can get different edge unfoldings depending on which edges are cut.

[Ex.] A cube has 11 different edge unfoldings.



Overlapping / Non-overlapping

When the polyhedron is edge unfolded along the thick lines…



Overlapping unfolding

Overlapping / Non-overlapping

When the polyhedron is edge unfolded along the thick lines…

- ✔ Overlapping unfoldings
  - ➡ 946,449,303,862,164,770,256

How many are there for each?

Main results of this study

We proposed an approach for counting the number of non-overlapping unfoldings.

Target polyhedra

The existence of overlapping edge unfoldings is known.
[T. Horiyama and W. Shoji, 2011; T. Shiota and T. Saitoh, 2024; …]

Defini

If all faces of a convex polyhedron are regular polygons, it is called a convex regular-faced polyhedron.

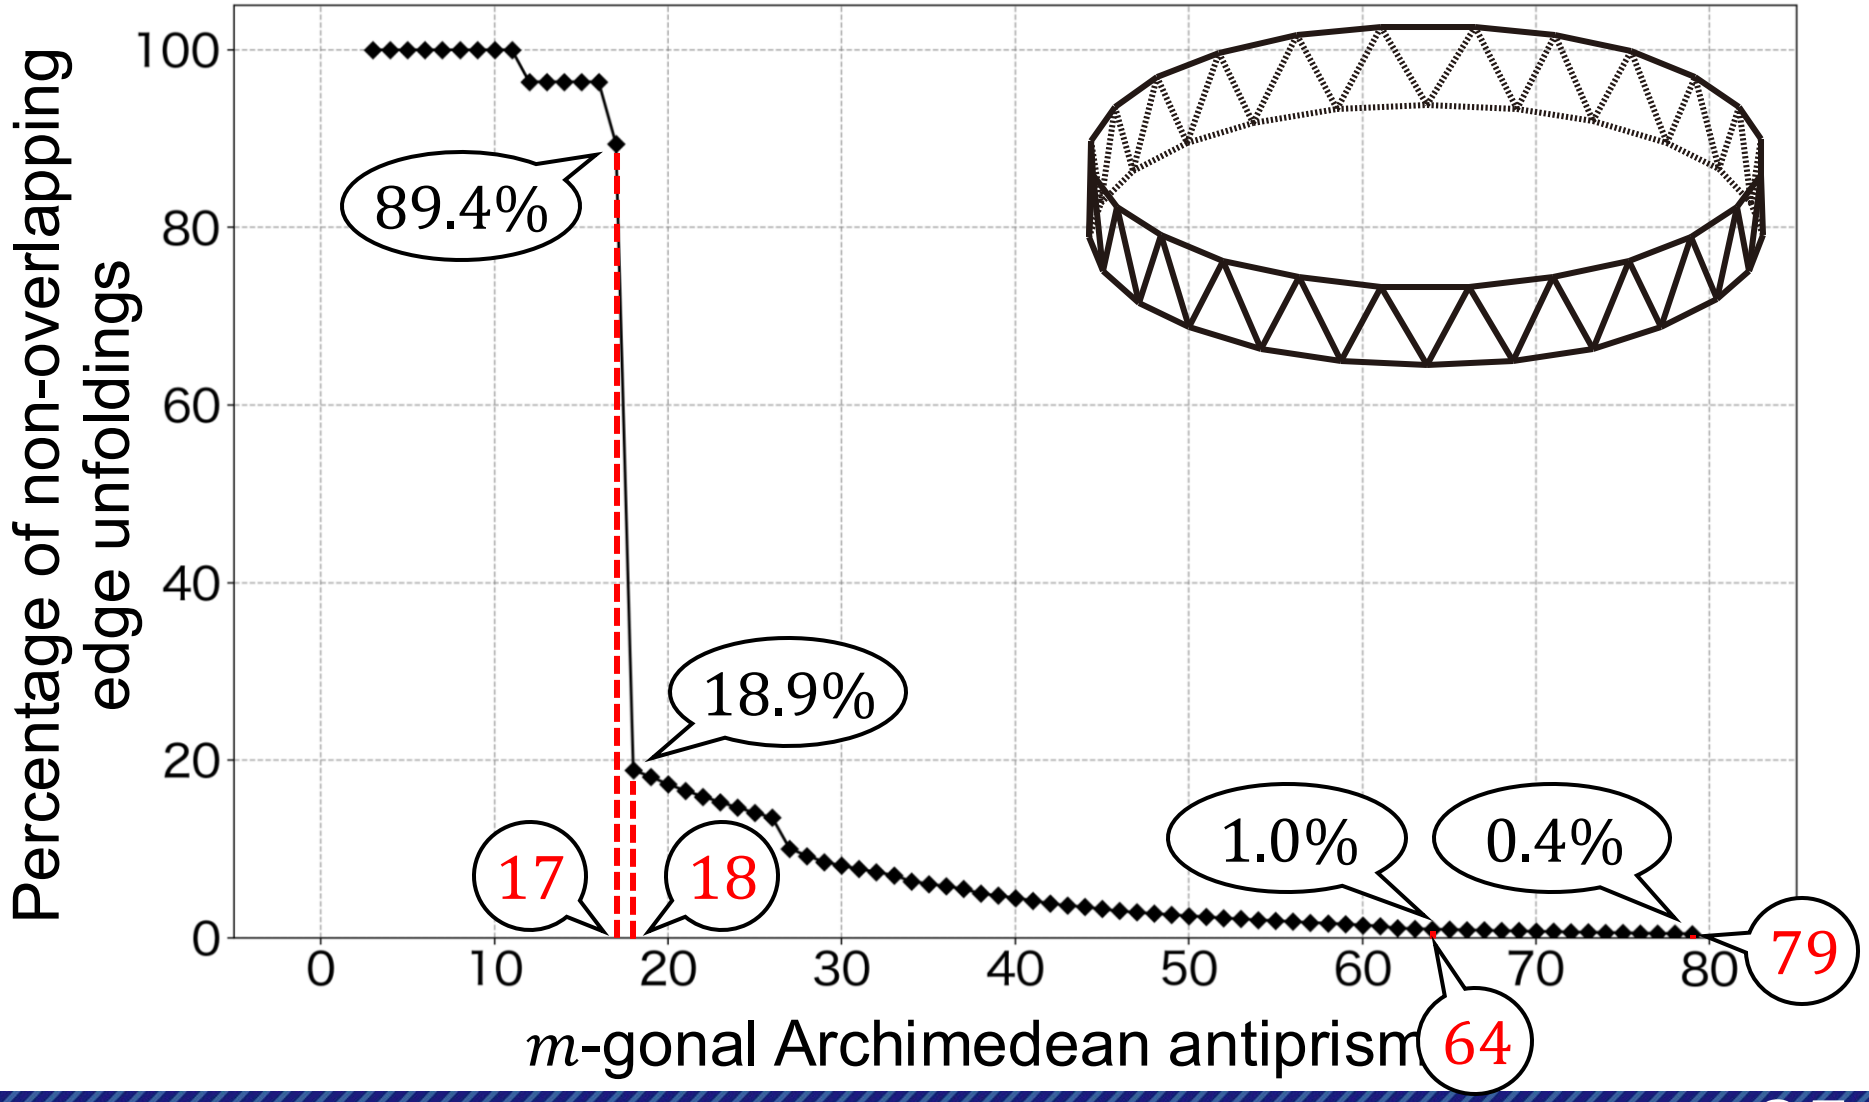
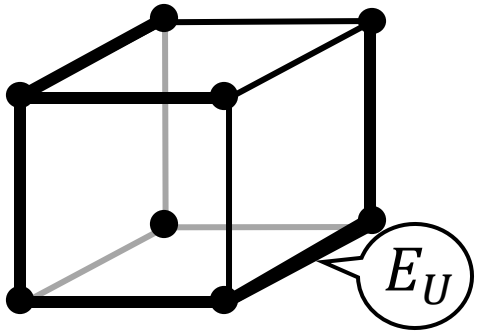
Results for Archimedean antiprisms

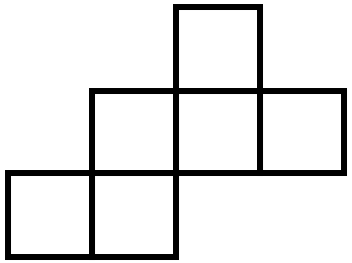


#(Edge unfoldings) include overlaps

Let V be the set of vertices and E the set of edges. Then, Q can be seen as a graph $G_Q = (V, E)$.



Polyhedron Q



Edge unfolding U

Theorem 3 [E. D. Demaine et al., 2007]

Let $E_U (\subset E)$ be the set of edges cut to obtain an unfolding U. Then, E_U corresponds to a spanning tree in G_Q.

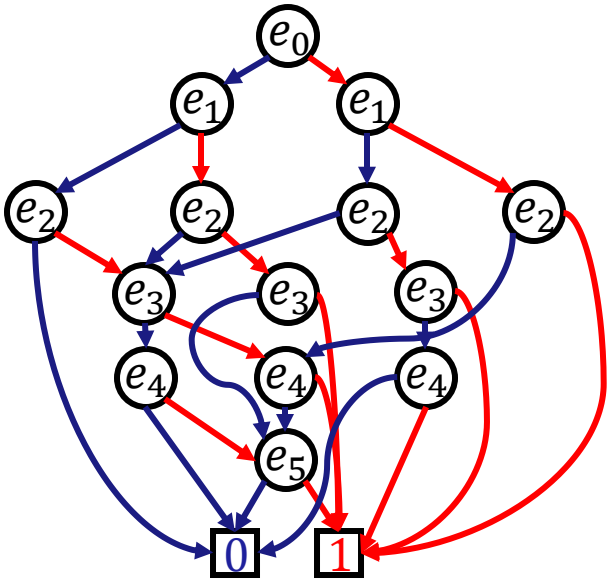
Key point:

If we want to get the number of edge unfoldings, we can count the number of spanning trees in G_Q instead.

#(Edge unfoldings) include overlaps

- #(Spanning trees in G) can be counted using ZDDs.

[J. Kawahara et al., 2017]



Zero-suppressed Decision Diagram (ZDD) [S. Minato, 1993]

A data structure that compactly represents a family of sets as a directed acyclic graph (DAG).

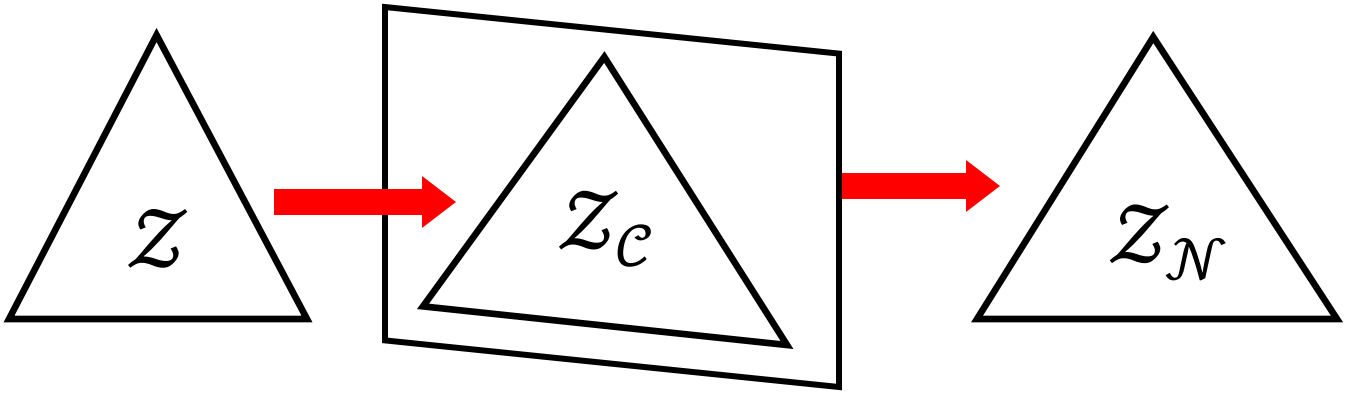
- We can use various operations over ZDDs.

$$\mathcal{Z}_{\mathcal{A}} \diamondsuit \mathcal{Z}_{\mathcal{B}} = \mathcal{Z}_{\mathcal{N}} \qquad \diamondsuit = \{\cup, \cap, \setminus, \ldots\}$$

Operations over ZDDs

Subsetting technique [H. Iwashita and S. Minato, 2013]

Constructs a new ZDD $\mathcal{Z}_{\mathcal{N}}$ by extracting a family of sets from an existing ZDD $\mathcal{Z}$ that satisfies a constraint $\mathcal{C}$.

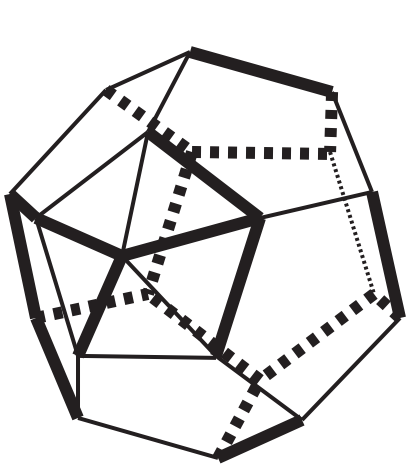


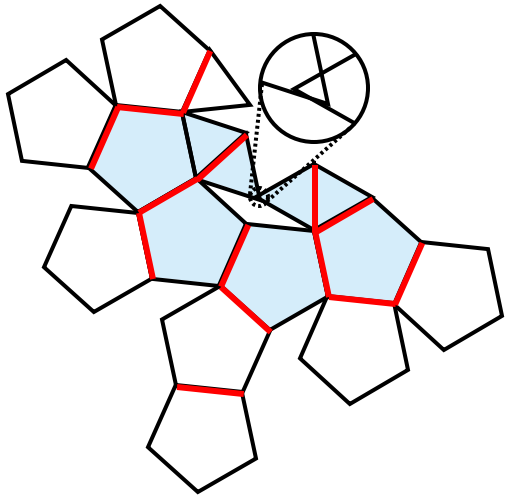
Key point:

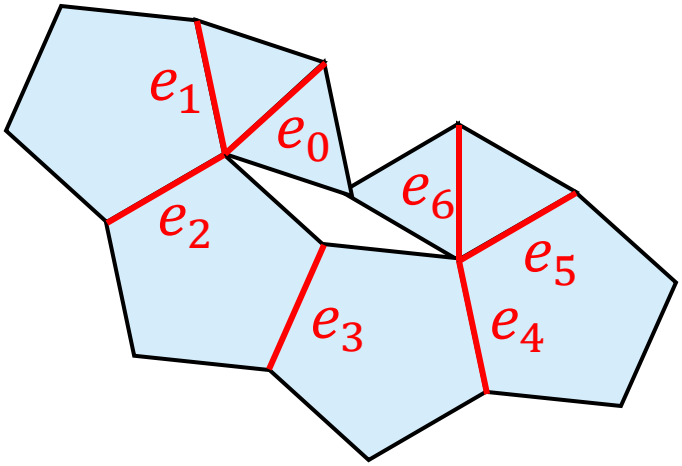
Using the subsetting technique, we removed overlapping edge unfoldings and counted #(non-overlapping edge unfoldings).

#(Non-overlapping edge unfoldings)

[Ex.] Overlapping edge unfolding U_1
[T. Shiota and T. Saitoh, 2024]







Minimal overlapping partial unfolding M_1

MOPU

$NC[U]$: Set of edges that are not cut in unfolding U

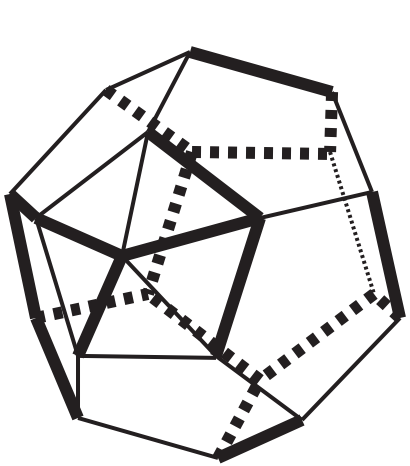
$NC[U_1] = \{e_0, e_1, \dots, e_6, e_7, \dots, e_{14}\}$ $NC[M_1] = \{e_0, e_1, \dots, e_6\}$

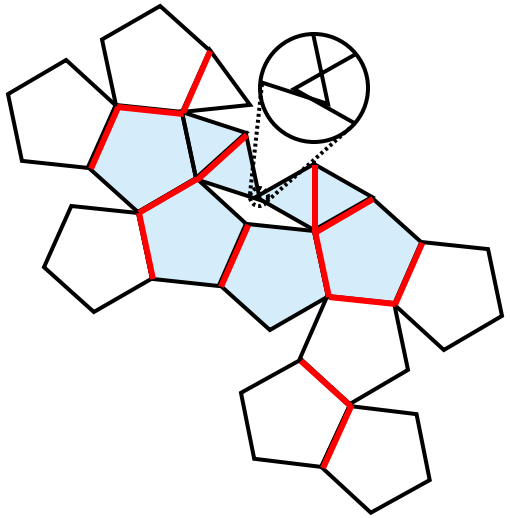
Key point:

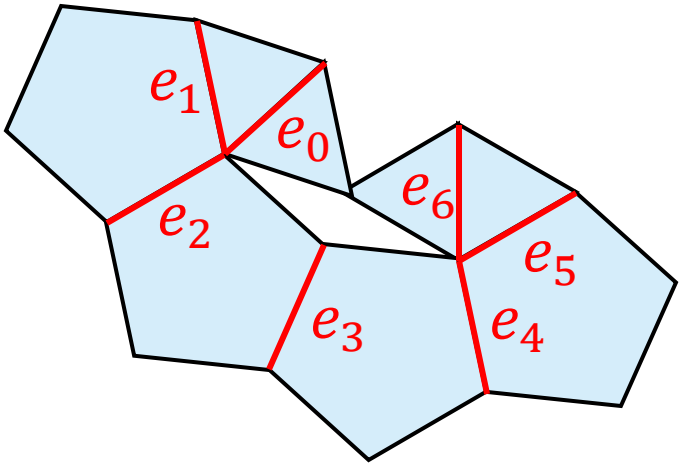
If $NC[M_1] \subseteq NC[U]$, the edge unfoldings always overlaps.

#(Non-overlapping edge unfoldings)

[Ex.] Overlapping edge unfolding U_1
[T. Shiota and T. Saitoh, 2024]







Minimal overlapping partial unfolding M_1

MOPU

$NC[U]$: Set of edges that are not cut in unfolding U

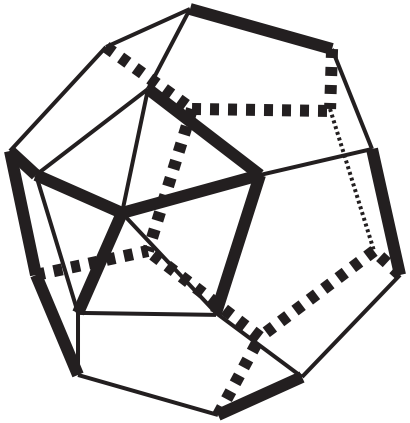
$NC[U_1] = \{e_0, e_1, \dots, e_6, e_7, \dots, x\}$ $\quad NC[M_1] = \{e_0, e_1, \dots, e_6\}$

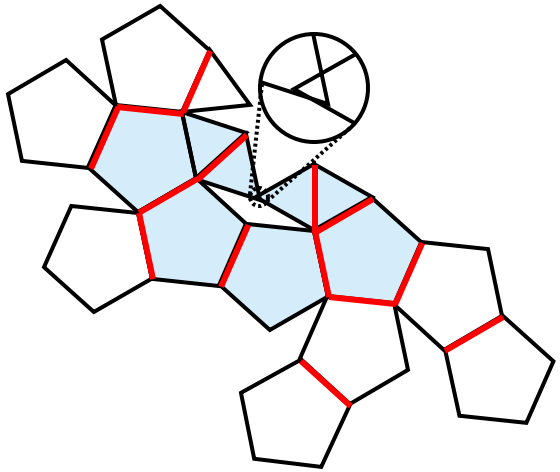
Key point:

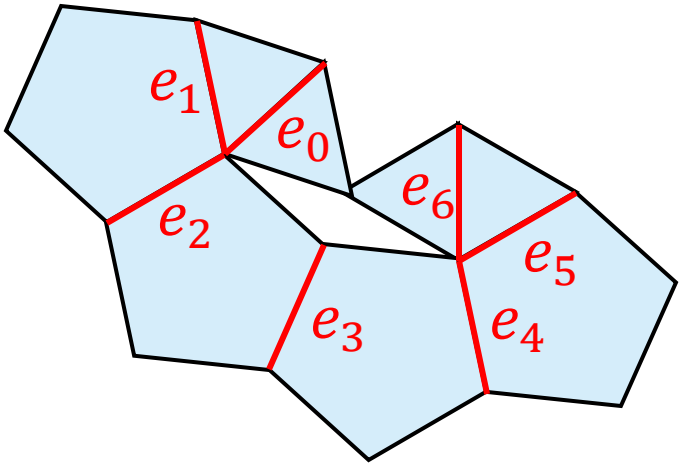
If $NC[M_1] \subseteq NC[U]$, the edge unfoldings always overlaps.

#(Non-overlapping edge unfoldings)

[Ex.] Overlapping edge unfolding U_1
[T. Shiota and T. Saitoh, 2024]







Minimal overlapping partial unfolding M_1

MOPU

$NC[U]$: Set of edges that are not cut in unfolding U

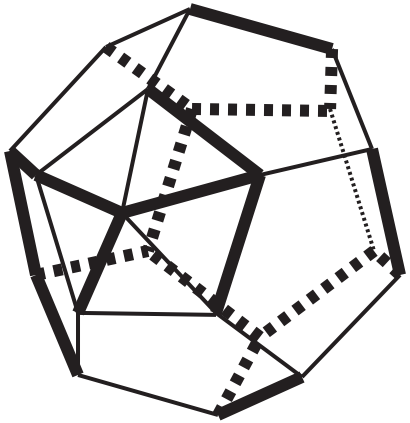
$NC[U_1] = \{e_0, e_1, \dots, e_6, a, \dots, x\}$ $\quad$ $NC[M_1] = \{e_0, e_1, \dots, e_6\}$

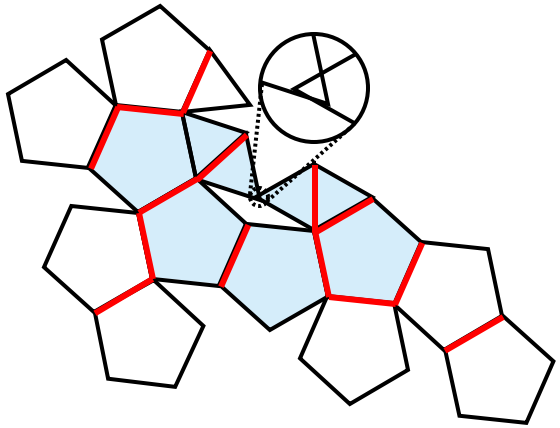
Key point:

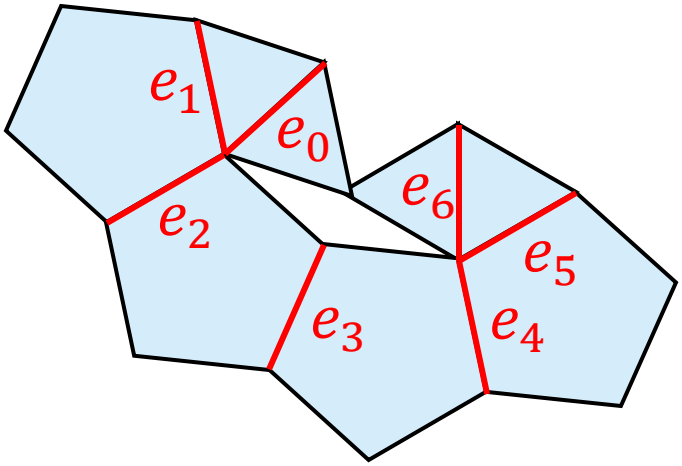
If $NC[M_1] \subseteq NC[U]$, the edge unfoldings always overlaps.

#(Non-overlapping edge unfoldings)

[Ex.] Overlapping edge unfolding U_1
[T. Shiota and T. Saitoh, 2024]







Minimal overlapping partial unfolding M_1

MOPU

$NC[U]$: Set of edges that are not cut in unfolding U

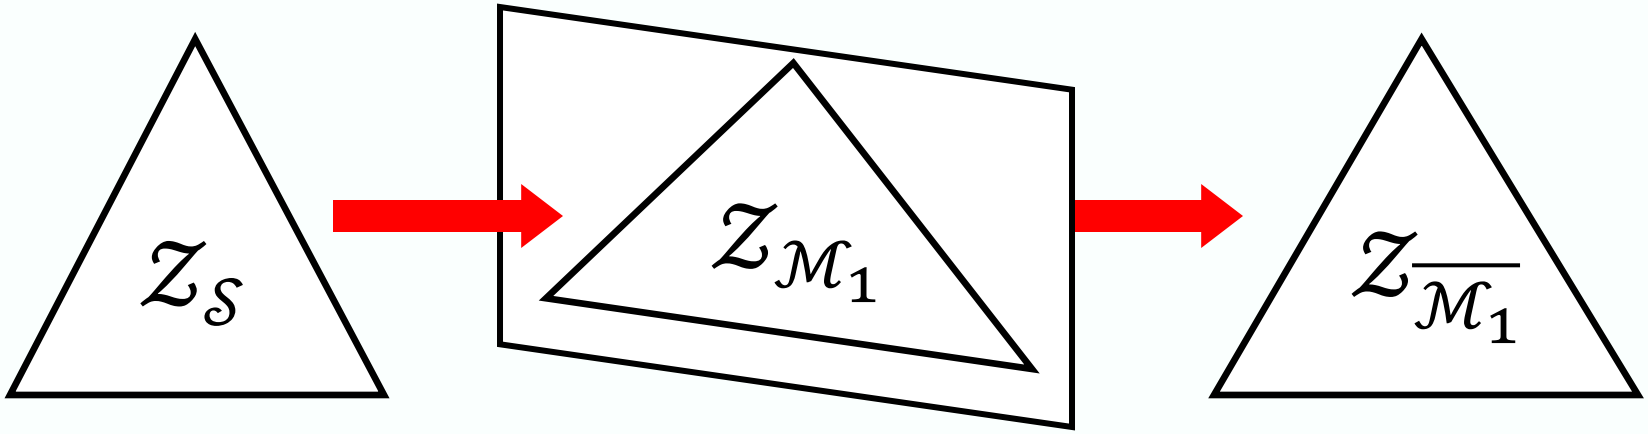
$NC[U_1] = \{e_0, e_1, \dots, e_6, a, \dots, y\}$ $\quad$ $NC[M_1] = \{e_0, e_1, \dots, e_6\}$

Key point:

If $NC[M_1] \subseteq NC[U]$, the edge unfoldings always overlaps.

#(Non-overlapping edge unfoldings)

Subsetting technique



All edge unfoldings

The family of sets that contains all elements of $NC[M_1]$

The edge unfoldings that do not include M_1 as a partial unfolding

$NC[U_1] = \{e_0, e_1, \dots, e_6, a, \dots, y\}$ $NC[M_1] = \{e_0, e_1, \dots, e_6\}$

Key point:

If $NC[M_1] \subseteq NC[U]$, the edge unfoldings always overlaps.

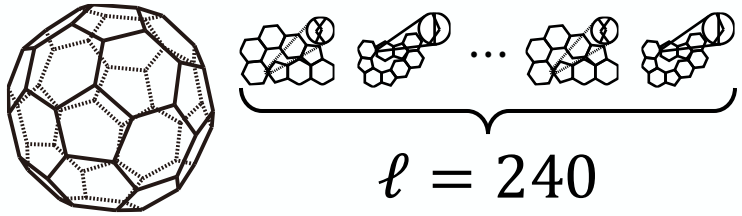
#(Non-overlapping edge unfoldings)

- MOPUs M_k can be enumerated using rotational unfolding.

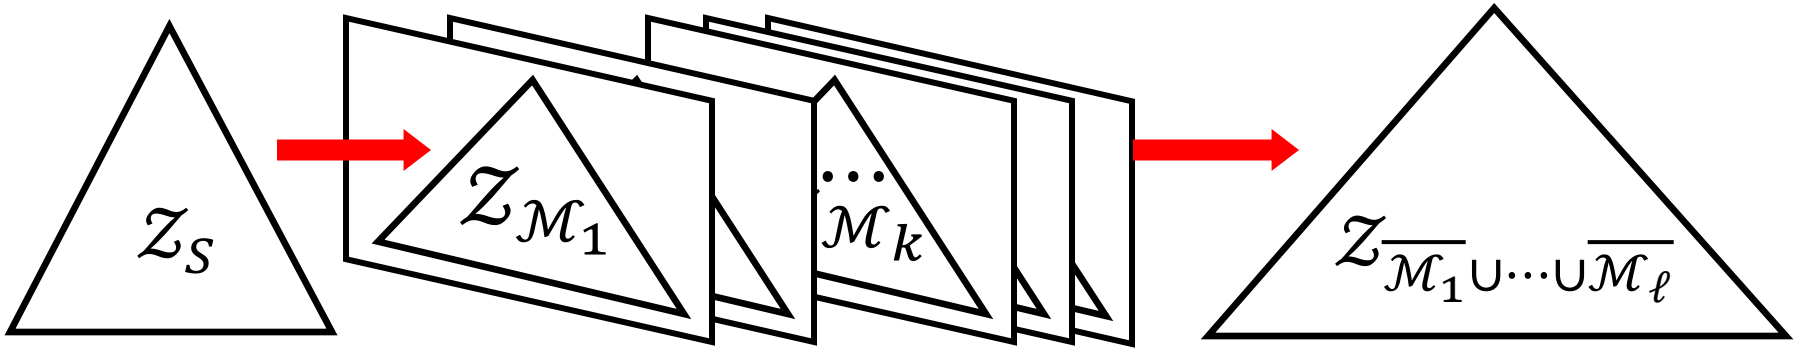
  [T. Shiota and T. Saitoh, 2024]

ℓ: #(MOPUs) in a polyhedron Q

Truncated icosahedron



- Apply the subsetting technique to all MOPUs M_k $(1 \leq k \leq \ell)$



The ZDD representing non-overlapping edge unfoldings.

The edge unfoldings that do not include any M_k as a partial unfolding

Conclusion

- Developed an algorithm to count the number of non-overlapping edge unfoldings
- Applied the algorithm to the 175 types of convex regular-faced polyhedra
